We present an interface package, called ES2MS[1], for passing self-consistent charge density and potential from Electronic Structure (ES) codes To Multiple Scattering (MS) codes. MS theory is based on the partitioning of the space by atomic-size scattering sites, so that the code provides the charge densities and potentials for each scattering site. For pseudo potential codes, such as VASP[2], the interface solves Poisson equation to construct the all-electron potential on the radial mesh which is used to solve the transition operators (T-matrix) and Green's functions in MS codes. Recently we have further developed the interface for Gaussian09 [3] and SPR-KKR [4]. In the case of Gaussian 09, the Poisson equation is solved by a recurrence relation based on the set of Gaussian basis. We show the algorithm of the interface and the examples.
